

## How Vaibhav Empire secured its data using LepideAuditor for File Server?

---

Established in 1964 as Vaibhav Jewelers and later converted to Vaibhav Empire doesn't need any introduction in South India especially in Hyderabad where it is located. With an aim for "a richer tomorrow for its stakeholders", Vaibhav Empire is continuously expanding its business.

Vaibhav Empire was facing a problem in identifying the users who were accessing the files and folders and making changes in a shared folder. The traditional native auditing of Windows File Servers was not proving enough because of the too much technical detail and multiple logs for a single action. It was not possible for their IT staff to tackle who has made which change to which file when and from where. The biggest question was how to discover what all permissions have been modified. If these changes remain undetected completely, there can be a risk for the security of crucial data stored in these files and folders.

IT staff was looking for a solution to get the answers of these questions as the first step to enhance data security. First, their attention was grabbed by some expert views talking about how native auditing can be used for identifying the users accessing and making changes in shared folders. Again, this solution was not looking feasible because of the noise involved therein and non-availability of a scheduler to dispatch periodic reports on file access.

Ultimately, IT Staff @ Vaibhav Empire discovered the peace of mind with search of LepideAuditor for File Server, a unique file server auditor by Lepide Software. Before buying its license, they installed its Free Trial version and tested it as per their requirements. The results are more than awesome, as they are receiving the details of who all users are accessing the shared folder and what changes are being made by whom, when and from where. Software is now displaying the changes in permissions, file accesses, file changes, and even file copy event for shared folders.

IT Staff is now regularly getting daily, weekly, or monthly reports periodically to keep a check on the integrity of data stored on their servers.

As per Vaibhav Empire,

*“Complete solution to know who is accessing and changing files in shared folder.”*

As per them, the best feature is the instant alerts through SMS in their mobile phones, emails in their inbox and onscreen messages on computers regarding suspicious changes and/or unwanted accesses.

### **About LepideAuditor for File Server**

LepideAuditor for File Server is a unique solution to audit the changes at Windows File Server and NetApp Filers. It generates in-depth audit reports for the added servers. Software sends instant alerts through email, SMS on mobile and desktop notifications on networked computers about the suspicious file accesses or unwanted changes in file server.
