

FIRST LEGAL

A CASE STUDY IN THE LEGAL INDUSTRY

Miguel Meza
Senior IT Manager

Dealing with Lepide support has been an efficient use of our time when making changes or setting up reports. And working with the Lepide Sales team has been a pleasure since our sales manager was very honest and sincere.

Over 800 employees

19 Offices Across the USA

Thousands of U.S. Customers

Bound By Both HIPAA and GDPR

Visibility Over AD Was a Priority

Why First Legal Chose Lepide to Improve Their Active Directory Visibility and Achieve Both HIPAA and GDPR Compliance

This case study was created to show how a global law firm in the United States was able to use Lepide to improve the security of their data and the surrounding IT infrastructure, whilst simultaneously driving down costs and meeting both HIPAA and GDPR compliance.

First Legal is a litigation support company of individuals united in the common purpose of service.

The Need For a Solution

First Legal were experiencing problems with the security and visibility of their Active Directory environment. They did not have a real way to see what configuration and permission changes were taking place that could be affecting their security. They also wanted an easy way to report on Active Directory changes. Without a dedicated Data Security Platform, this simply was not possible to achieve. In addition to Active Directory security concerns, First Legal had also made commitments to become both HIPAA and GDPR compliant going forward. This required higher levels of visibility and detailed reporting that a Data Security Platform could provide.

The Results

First Legal set about solving this problem as many others do; through Google searches. They discovered Lepide and attended their online demo webinar. Lepide was seriously considered against a number of other solutions, but Lepide was eventually chosen because it was the best fit to the company requirements. They also found that the Lepide support team were very knowledgeable and friendly, making the whole experience more enjoyable.

Lepide's Data Security Platform helped First Legal overcome the lack of visibility that they had over their Active Directory, saving them the time it would take to manually review event logs. The real time alerts and scheduled reports were able to successfully notify First Legal whenever a large number of files were modified and when Active Directory user permissions were added or changed. The anomaly spotting technology also enabled the IT team to spot anomalous user activity, excessive permissions, and unsuccessful AD logon attempts.
