

Datasheet

Lepide for
OFFICE 365

Summary

Audit Interactions With Data

All key “who”, “what”, “when” and “where” audit questions answered in a single place for every change made.

Monitor Data Access

Find out which of your users are accessing sensitive data in SharePoint Online and OneDrive.

Audit Non-Owner Mailbox Activity

Ensure you know whenever mailboxes are accessed by someone other than their owner in Exchange Online.

Analyze Permission Changes

Spot changes to permissions and configurations that may prevent you from implementing zero trust.

Classify Sensitive Data

Identify, classify, tag and score data based on the content, risk and compliance mandate it is governed by.

Real Time Alerts

Critical alerts delivered in real time to your email or to the Lepide mobile app and execute threat responses on the go.

Pre-Defined Threat Models

Hundreds of pre-defined reports and threat models designed to improve security and meet compliance.

Keep an Eye on Teams Users

See how your users are interacting with sensitive data on MS Team, including whether data is being shared.

Compliance Reporting

Generate compliance-ready reports for a number of regulations, including HIPAA, PCI, Sox, FISMA, GDPR, CCPA and more.

Key Security Features for Office 365

Identify Sensitive Data Being Shared and Lock it Down

Mike from Finance sent James (your newest account representative) their sales targets for the month in a private chat on Microsoft Teams. That file contains sensitive data you don't want James to be able to access.

Using Lepide, you can spot events like this in real time using our data classification solution and take action to reverse the permissions that have been granted from within the solution.

Prevent Data Breaches with Behavior Analytics

Real time alerts on user behavior and critical changes provide the who, what, when, where information, before and after values, risk value, data sensitivity and more.

Our in-built threat models can trigger automated responses for any number of changes that are detected, from potential rogue admins to ransomware attacks in motion. Automatically kill active sessions, disable users, alert admins and more.

Monitor User Activities in Microsoft Teams

See how your users are interacting with Microsoft Teams, including when sessions are started, when new teams are created, when new channels are created and more. Spot when users are sharing sensitive information and determine who now has access to that data so that you can remediate access if required.

Audit Changes in Exchange Online

Through numerous predefined reports and real time alert capabilities, you can audit every change in the configuration of Exchange Online, including changes to mailboxes, eDiscovery, Remote domain lists, Unified Messaging and policies. These reports are tailored to suit numerous compliance mandates, including GDPR, PCI, HIPAA, FISMA and more. You can also monitor all changes being made to permissions to ensure that no unwanted access privileges or administrative rights are granted unknowingly.

Audit Changes in SharePoint Online

As crucial data is stored and shared in SharePoint Online, it's important that you are able to audit any changes that take place to configurations or permissions. From an intuitive dashboard, you will be able to see all user activities in this cloud platform, including changes to objects, permissions, groups and more. This information is provided through continuous updates in the LiveFeed and via real time alerts delivered to your inbox.

Audit Changes in Azure AD

Lepide Office 365 Auditor enables you to audit, monitor and alert on any changes to Privileged Users/Groups as well as configurations to help you improve the security of this cloud-based directory and identity management service. We can help you meet all manner of compliance requirements and enable security controls by providing a full audit trail of every user authentication.

Audit Changes in OneDrive for Business

Unlike SharePoint Online, content stored on OneDrive for Business should not often be shared as it is usually business-critical. Lepide Office 365 Auditor enables you to improve the security of this cloud-storage platform by tracking changes to files and folders, security groups and configurations. This will enable you to get better insight into any unwanted changes taking place surrounding your most sensitive data.
