Lepide for

SHAREPOINT ONLINE

Introduction

Millions of organizations have already migrated from their traditional file management systems to SharePoint Online, and more businesses are migrating every day. If you're storing crucial data in SharePoint Online, it is essential that you audit this cloud environment. You should be able to see all changes taking place in order to increase your security and meet compliance demands. Lepide SharePoint Online Auditor helps simplify this task for you through easy and continuous auditing of SharePoint Online.

Classify Sensitive Data

Locate and classify sensitive data according to the sensitivity of the content and its relation to compliance requirements.

Track and Analyze Permission Changes

Determine who has access to which files and folders and track permission changes to help spot excessive permissions and at-risk data.

Automated Report Sharing

The pre-defined audit reports in Lepide SharePoint Online Auditor can be scheduled and automatically shared with selected recipients.

Key Security Features for Windows File Server

Lepide's SharePoint Online solution tracks all changes made to SharePoint Online permissions. Overcome the limitations of native SharePoint Online auditing by providing reports that are readable, actionable and detailed.

Track Permission Changes

Our Solution keeps track of all changes made in the permissions of documents, folders, lists, libraries and site collection. It sends real-time or threshold-based alerts on critical permission changes via email, as updates to Live Feed report and as push-notifications to Lepide Mobile App. This continuous permission change monitoring helps you avoid unauthorized data access and privilege abuse.

Automated or Manual Report Sharing

Our predefined audit and compliance reports can all be scheduled to be delivered to intended recipients through email or by storing at a shared location. If you opt to save the reports on the disk, the target users will be notified automatically by email.

Classify Data at the Point of Creation

Lepide allows you to classify sensitive data on a schedule and at the point of creation so that you can easily spot where your most sensitive data is. This helps focus your security efforts on the data that matters the most.
