Drayke Jackson
Security Engineer

"LepideAuditor is straightforward to use and effective right off the bat. Plus, the level of patience, attentiveness and technical knowhow is far beyond most support and sales teams I've seen before."

Discover, classify and secure your sensitive data to improve overall data security and meet compliance

Lepide's Data Discovery and Classification solution enables all members of the security team to get real, actionable insight into the location and sensitivity of data.

By determining where your sensitive data is and why it is sensitive you can prioritize how you are going to secure it, who should have access to it and more.

Satisfy compliance requirements by proving to auditors that you are able to locate and classify PII, PHI, payment card data, intellectual property and more.

PRIORITIZE SENSITIVE DATA FIRST

Identify the data that has the highest concentration of sensitive information (such as PII, PHI, IP, PCI and more) so that you can prioritize security.

PROTECT DATA FROM EXPOSURE

Locate the files that contain sensitive data and ensure they have appropriate access controls applied to them to limit the risk of privilege abuse.

DETECT THREATS TO SENSITIVE DATA

Spot anomalous user activity, unwanted changes to sensitive data and changes to permissions that could affect security.

REACT QUICKER TO BREACHES

Analyze the sensitivity of the data involved in a breach and what information was involved so that you can notify the correct authorities quicker.

PROVE COMPLIANCE TO AUDITORS

Demonstrate to auditors that your security controls are effectively applied to the data that matters the most.

REMOVE FALSE POSITIVES

Attach keywords/phrases to exclude or include in your discovery to help filter out false positives and improve accuracy.

PRE-DEFINED DISCOVERY RULES

We have created rules for identifying data subject to compliance regulations, including GDPR, HIPAA, PCI, CCPA and more. Customize these rules to suit your needs.

TAG CRITICAL INFORMATION

Embed classification information into the file itself to increase overall accuracy of the discovery process and get the most out of your data loss prevention (DLP) or information rights management (IRM) tools.
